OPTICS AND SPECTROSCOPY

- **OPTICS AND SPECTROSCOPY** publishes, in English translation, original experimental and theoretical studies in physical optics, atomic and molecular spectroscopy including that of solids, and the application of optical techniques to the study of solids, luminescence, and general problems of electron optics, photometry, applied optics, optical instrumentation, and laser research. *Optics and Spectroscopy* is the leading Russian journal in its field, its coverage corresponding in part to J. Opt. Soc. Am. although the spectroscopy papers are more theoretical in content. Luminescence and the optical properties of materials are fully represented, instrumental optics, diffraction and coherence problems less so.
- **FIRST, SECOND AND THIRD CUMULATIVE INDEXES OPTICS AND SPECTROSCOPY, VOLUMES I THROUGH X 1966-1961, VOLUMES XI THROUGH XX 1961-1966, VOLUMES XXI THROUGH XXX 1966-1971.** These Cumulative Indexes include full information on the first five volumes which have never been translated in toto, as well as on Volumes VI-XX, which have been published monthly by OSA in cover-to-cover translation. These Cumulative Indexes also list individual translated papers from the first five volumes and information where these translations may be obtained.
- **LUMINESCENCE (Supplement 1)** is a collection of some 60 papers reporting a wide variety of work in electronic spectroscopy and luminescence. Topics include experimental determination of the stimulation of ZnS phosphors by infrared radiation, x-ray electroluminescence from alkali halide single crystals, the spectroscopy of crystalline solutions of diphenylpolyenes, and theoretical treatments of transitions in complex molecules and the relationship between recombination luminescence and exo-emission.
- **MOLECULAR SPECTROSCOPY I (Supplement 2)** includes some 63 papers ranging in topic over electronic transitions in N_2 and Al, EPR spectra of macro-radicals, vibration spectra of silicates, strontium nitrate, cyclohexane, cyclopropane derivatives, paraffins, and hydrogen bonded substances. Theoretical treatments include a consideration of nonadiabatic transitions, optical rotatory dispersion temperature effects, normal coordinate calculations, and absolute intensities in vibration spectra.
- **MOLECULAR SPECTROSCOPY II (Supplement 3)** contains some 64 articles covering a broad spectrum of interests: Raman spectra of adsorbed species, intensities and line widths in Raman spectra; ir spectra of Cu chelates, O_3 in clathrates, carbohydrates, hydroperoxides, CH_4 in liquid N_2 and O_2 ; hydrogen bonded complexes; temperature and environmental effects. Theoretical papers treat force fields, sum rules for vibrational intensities, organo-silicon compounds, X_3H_3 molecules, Fermi resonance. Authors include L. M. Sverdlov, M. O. Bulanin, N. P. Kharchenko, N. G. Yaroslavskii.
- **SOLID STATE SPECTROSCOPY** contains over fifty original articles on such subjects as: calculations of crystal fields; the effect of temperature, deformation, and dislocation density on luminescent spectra; Raman scattering from crystals and crystalline powders; Faraday effect in crystalline and amorphous solids; luminescence and absorption spectra of many doped crystals as well as amorphous solids.
